232-35-471	**Hafeja Akter**

Submission Date: 04/10/2026

Project Overview:
Tuition Finder is a web platform where guardians can find qualified tutors and tutors can find tuition jobs in one organized place. Tutors create profiles, guardians post tuition requirements, tutors apply, and guardians accept or reject applications. An admin verifies tutors, moderates posts, and monitors the system. The platform replaces unstructured Facebook posts and word-of-mouth searching with a searchable, trustworthy system.

Project Stakeholders:

Stakeholders	Roles
Guardian	Posts tuition requirements, reviews applicants, hires a tutor
Tutor	Creates a profile, searches and applies for tuition jobs
Admin	Verifies tutors, moderates posts, manages users, views reports
Developers	Verifies tutors, moderates posts, manages users, views reports
Supervisor	Guides and evaluates the project

Business Need:
Today, most tuition is arranged through Facebook groups or personal contacts. This is time-consuming, unreliable, and open to fake profiles and scams. There is no standard way to filter tutors by subject, area or salary, and no way to check a tutor's reputation. An organized platform with verified tutors, filtered search and reviews saves time and builds trust for both sides.

Tech Stack:
- Language: Python
- Frontend Framework: React
- Backend framework: Django
- Styling: Bootstrap 4
- ORM: Django ORM
- Deployment: AWS

Functional requirements:

Module 1: User & Authentication

1. Register and login with role selection (Guardian / Tutor), with role-based access
2. Tutor profile create and edit (subjects, education, experience, expected salary, area)
3. Guardian profile create and edit
4. Admin tutor verification (approve / reject)

Module 2: Tuition Management

1. Guardian creates, edits and deletes tuition posts
2. Search and filter posts (class, subject, area, salary)
3. Tutor applies to a tuition post
4. Guardian accepts or rejects applications

Module 3: Review & Admin

1. Guardian gives review and rating to a tutor
2. Admin manages users (view, block, unblock)
3. Admin moderates posts (approve, remove)
4. Admin dashboard (total users, posts, successful matches)

Non-functional Requirements:

1. **Performance:** Pages should load within 3 seconds under normal use.
2. **Security:** Passwords are hashed (bcrypt) and authentication uses JWT. Routes are protected by role.
3. **Usability:** The UI is mobile responsive and easy to navigate.
4. **Reliability:** A tutor cannot apply to the same post twice, and blocked users cannot log in.
